Brake test kit  
for deck machinery

### Test your brake holding capacity easily on board

Over time, the brake linings on the drum band brake can start to wear down. This affects the holding capacity and the performance of your equipment.

The Brake Test Kit is a simple and effective means of testing the brake holding capacity of your drum band brake. It is necessary to test the brake holding capacity after modifications or repair.

This kit is designed in line with OCIMF regulations. These require that you test the brake holding capacity of your drum band brake at least once a year to ensure performance and safety.

The Brake Test Kit is available as a single unit so that you can easily perform the test yourself on board.

### Brake test kits

- Suitable for MacGregor brands (e.g. Hatlapa, TTS, Kocks, Pusnes etc.) and for other brands
- Available for a brake load up to 30, 60 and 70 tons
- Minor modification necessary
- Test calculation based on equipment technical specifications - review by MacGregor experts

If you are interested in an offer tailored to your needs, please do not hesitate to contact your responsible sales expert or contact us at the following address:
